CUDA

Date 29 / 9 / 26

To know the Number of Blocks, we use $\rightarrow$ $\text{BlockIdx.x} \rightarrow$ Block currently executed.

To know the Number of Threads, we use $\rightarrow$ $\text{threadIdx.x} \rightarrow$ Thread currently executing

Ex) $\text{printf} ("Block : \%d, Thread : \%d \n", \text{BlockIdx.x}, \text{threadIdx.x})$

Point to be noted $\rightarrow$ It prints Block/thread inside its and / Block repeatedly

And

Date / /

BlockDim.x

It tells the total Number of Threads running inside a Block.

Ex) $\langle\langle\langle 2, 4 \rangle\rangle\rangle$

B1 $\rightarrow$ blockDim.x $\rightarrow 4$

B2 $\rightarrow$ blockDim.x $\rightarrow 4$

$\Rightarrow$ Cuda does not guarantee that blocks execute in Numerical order, ex)
It can execute block 1 before block 0.
